**seow\_khee\_wei@rp.edu.sg**

**Vincent Ng**

**vincent\_ng@rp.edu.sg**

# Programme Day Two

---

## Morning

- Read and writing files
- Copying, moving and deleting files and folders
- Working with Excel
- Image Processing

## Afternoon

- Connecting to the Web
- Sending emails
- Creating charts
- Generating PDF

# Schedule

---

Time	Activity
9.00am – 10.20am	File I/O + File/Folder operations
10.20am – 10.40am	Break
10.40am – 12.00pm	Excel + Images
12.00pm – 1.30pm	Lunch
1.30pm – 2.50pm	Web + email
2.50pm – 3.10pm	Break
3.10pm – 4.30pm	PDF + charts
4.30pm – 5.00pm	Survey / Q&A

# File Paths

---

**Absolute** file paths are notated by a **leading forward slash or drive label**.

For example,

```
/home/example_user/example_directory
```

or

```
C:/system32/cmd.exe
```

An absolute file path describes how to access a given file or directory, starting from the root of the file system.

**Relative** file paths are notated by a **lack of a leading forward slash**.

For example,

```
example_directory.
```

A relative file path is interpreted from the perspective your current working directory. If you use a relative file path from the wrong directory, then the path will refer to a different file than you intend, or it will refer to no file at all..

# Read files

```
1 # make sure you have a hello.txt in your current working director
2 # same directory as your python script
3 helloFile = open("hello.txt")
4 content = helloFile.read()
5 print(content)
6 helloFile.close()
7
8 # make sure you have a hello.txt in the specified director
9 # same directory as your python script
10 helloFile = open("hello.txt")
11
12 content = helloFile.readlines()
13 print(content)
14
```

Open() will return a file object which has reading and writing related methods

Pass 'r' (or nothing) to open() to open the file in read mode.

Call read() to read the contents of a file

Call close() when you are done with the file.

- Call readLines() to read the contents of a file

3.5.6 |Anaconda, Inc.| (default, Aug 26 2018, 16:30:03)  
[GCC 4.2.1 Compatible Clang 4.0.1 (tags/RELEASE\_401/final)]  
Python Type "help", "copyright", "credits" or "license" for more i  
[evaluate file\_copy\_01.py]

- `shutil.copy(src, dst)` – Copy the file *src* to the file or directory *dst*
- `shutil.copytree(src, dst)` - Recursively copy an entire directory tree rooted at *src*.
- `shutil.move(src, dst)` - Recursively move a file or directory (*src*) to another location (*dst*).

<https://docs.python.org/3/library/shutil.html>

# Deleting files

---

```
import os

# error if file do not exist
os.unlink("hello.txt")

# get current working directory
print(os.getcwd())

# delete directory (can only delete empty folder)
os.rmdir("folder3")

import shutil
# delete directory (with content)
# error if folder is not found
shutil.rmtree("folder3")
```

- `os.unlink()` will delete a file
- `os.rmdir()` will delete a folder (but folder must be empty)
- `shutil.rmtree()` will delete a folder and all its contents

e.g. To delete all .docx file in the current folder

```
import os

for filename in os.listdir():
    if filename.endswith(".docx"):
        print(filename)
        os.unlink(filename)
```

Deleting can be dangerous, so do a dry run first

# send2Trash module

- Install send2trash module using pip.exe  
`pip install send2trash`
- `send2trash.send2trash()` will send a file or folder to the recycling bin

```

```

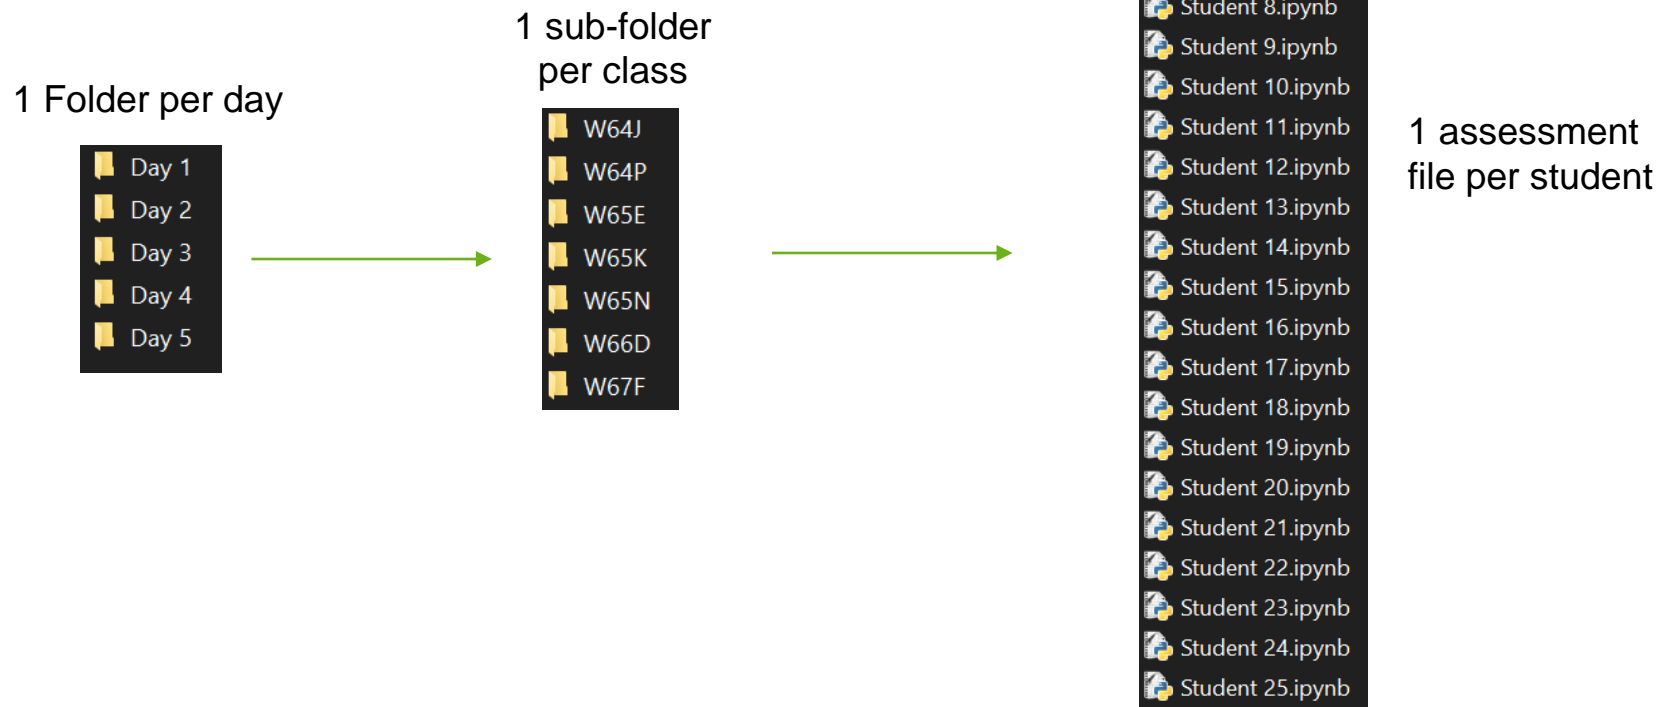

```
>>> import send2trash
>>> send2trash.send2trash("D:\\folder2\\new_hello.txt")
```

# Use Case Sharing

- Generating 600+ students assessment files, organized by day of week and classes folder
  - 5 Days of week
  - ~7 Classes a day
  - ~22+ students per class

# Other Use Cases

---

- System administrators can use these commands to
  - Copy and backup files to other hard-disks
  - Delete folders/ files at fixed schedules
    - End of financial year?
    - End of semester?
- Others use
  - Check timestamp of files, and delete all files created before a certain date

# Exercise

---

- **Write code to achieve the following:**
  1. Create a file named: “myfile.txt”.
  2. Write the following line of text into the file:
    - Programming is fun!
  3. Close the file
  4. Create a folder called “myfolder”
    - Use `os.mkdir()` command
  5. Copy myfile.txt to myfolder

# Python Package Index

---

- <https://pypi.org/>
- A repository of software for the Python Programming Language
- Python Installation provides the core libraries needed for the common tasks
  - Additional packages can be found at the website and installed as extension
    - E.g. send2trash, openpyxl, pillow etc
- Installation is easy done with the following command
  - **pip install <software\_package>**
- Installed packages can be found at:
  - C:\python38\Lib\site-packages

# Using pip install

---

- **For all windows users by default**
  - Open command prompt
  - `pip install <package_name>`
- **For Mac User**
  - Open terminal
  - **pip3** install <package\_name>
- **For RP staff using RP issued laptop**
  - Open command prompt
  - `pip install --user <package_name>`

Double-Dash

# Excel Spreadsheet Manipulation with Python

# Working with Excel

- Install openpyxl module using  
“`pip install openpyxl`”
- Full openpyxl documentation:  
<https://openpyxl.readthedocs.io/en/stable/index.html>

The screenshot shows the PyPI page for openpyxl 3.0.3. The header is blue with the text 'openpyxl 3.0.3' and a 'Latest version' badge. Below the header, it says 'A Python library to read/write Excel 2010 xlsx/xlsm files'. The page is divided into two main sections: 'Navigation' on the left and 'Project description' on the right. The 'Navigation' section includes links for 'Project description', 'Release history', 'Download files', and 'Project links'. The 'Project description' section includes a 'coverage 95%' badge, an 'Introduction' section, and a 'Security' section.

**openpyxl 3.0.3** ✓ Latest version  
Released: Jan 11, 2020

A Python library to read/write Excel 2010 xlsx/xlsm files

**Navigation**

**Project description**

coverage 95%

**Introduction**

openpyxl is a Python library to read/write Excel 2010 xlsx/xlsm/xltx/xltm files.

It was born from lack of existing library to read/write natively from Python the Office Open XML format.

All kudos to the PHPExcel team as openpyxl was initially based on PHPExcel.

**Security**

By default openpyxl does not guard against quadratic blowup or billion laughs xml attacks. To guard against these attacks install defusedxml.

# Typical Workflow for Excel Automation

---

1

You are given some data in a spreadsheet

2

You want to do some or all of the following

- Analyze the data
- Manipulate the data

3

Output the processed data in another spreadsheet

# Reading Excel file

1) Import openpyxl

```
import openpyxl
```

2) Load Excel content into  
“workbook” object by  
specifying the file name

```
workbook = openpyxl.load_workbook("bmi.xlsx")  
sheet=workbook["Sheet1"]
```

3) Get the worksheet named  
"Sheet1"

```
name = sheet.cell(row=2, column=1).value  
weight = sheet.cell(row=2, column=2).value  
height = sheet.cell(row=2, column=3).value
```

4) Get the value of each cell  
by specifying the row and  
column

```
print("name:%s \tweight: %d \theight: %f " % (name, weight, height))
```

5) Get the value of each cell  
by specifying the row and  
column

# Reading Excel file

The typical workflow for reading excel file is to use a ***for*** loop to go through each row to read the data

```
import openpyxl
```

```
workbook = openpyxl.load_workbook("bmi.xlsx")  
sheet=workbook["Sheet1"]
```

1) Get the number of rows and columns

```
max_row = sheet.max_row # get number of rows
```

```
#loop through every row
```

```
for i in range(2, max_row + 1):
```

2) Use For loop to go through every row

```
    #read cell
```

```
    name = sheet.cell(row=i, column=1).value
```

```
    weight = sheet.cell(row=i, column=2).value
```

```
    height = sheet.cell(row=i, column=3).value
```

```
    print("name:%s \tweight: %d \theight: %f " % (name, weight, height))
```

3) Extract the status at Column C to check for attendance

# Update Excel file

```
import openpyxl
```

```
workbook = openpyxl.load_workbook("bmi.xlsx")  
sheet=workbook["Sheet1"]
```

```
max_row = sheet.max_row # get number of rows
```

```
# add a column header for bmi  
sheet.cell(row=1, column=4).value = "bmi"
```

```
#loop through every row  
for i in range(2, max_row + 1):
```

```
    #read cell  
    name = sheet.cell(row=i, column=1).value  
    weight = sheet.cell(row=i, column=2).value  
    height = sheet.cell(row=i, column=3).value
```

```
    bmi = weight / (height * height)
```

```
    sheet.cell(row=i, column=4).value = bmi
```

```
    print("name:%s \tBMI: %f" % (name, bmi))
```

```
#save the file
```

```
workbook.save("bmi_update.xlsx")
```

2) Load file into memory & get the sheet

1) Perform calculation with values taken from the excel files

2) Add comments to cell

5) Save the spreadsheet

# Create Excel file

If you have data in nested python list, you can write the data into an excel file.

```
import openpyxl
```

```
workbook = openpyxl.Workbook()
```

```
#get the default sheet  
sheet=workbook["Sheet"]
```

```
#create a list of tuples as data source
```

```
data = [  
    [225.7, 'Gone with the Wind', 'Victor Fleming'],  
    [194.4, 'Star Wars', 'George Lucas'],  
    [161.0, 'ET: The Extraterrestrial', 'Steven Spielberg']  
]
```

1) Some data in nested list

```
for row in data:  
    sheet.append(row)
```

2) Using for loop to add each row of data into the excel sheet

```
#save the spreadsheet  
workbook.save("movies.xlsx")
```

3) Save the spreadsheet

# Format Excel

```
import openpyxl
from openpyxl.styles import Font, PatternFill, Border, Side

workbook = openpyxl.load_workbook("bmi.xlsx")
sheet=workbook["Sheet1"]

#define the colors to use for styling
BLUE = "0033CC"
LIGHT_BLUE = "E6ECFF"
WHITE = "FFFFFF"

#define styling
header_font = Font(name="Tahoma", size=14, color=WHITE)
header_fill = PatternFill("solid", fgColor=BLUE)

# format header
for row in sheet["A1:c1"]:
    for cell in row:
        cell.font = header_font
        cell.fill = header_fill

#define styling
white_side = Side(border_style="thin", color=WHITE)
blue_side = Side(border_style="thin", color=BLUE)
alternate_fill = PatternFill("solid", fgColor=LIGHT_BLUE)
border = Border(bottom=blue_side, left=white_side, right=white_side)

# format rows
for row_index, row in enumerate(sheet["A2:C3"]):
    for cell in row:
        cell.border = border
        if row_index %2 :
            cell.fill = alternate_fill

workbook.save("bmi_format.xlsx")
```

1) Import necessary functions

2) Setup colors and styles

3) Loop through cell and set properties

# Excel Charts

- Openpyxl supports the creation of many types of charts
  - Area Charts
  - Bar and Column Charts
  - Bubble Charts
  - Line Charts
  - Scatter Charts
  - etc

# Create Excel Chart

---

```
import openpyxl
from openpyxl.chart import BarChart, Reference, Series
```

1) Import necessary functions

```
workbook = openpyxl.load_workbook("bmi.xlsx")
sheet=workbook["Sheet1"]
```

2) Load the data from excel file

```
chart = BarChart()
```

```
labels = Reference(sheet, min_col=1, min_row=2, max_row=3)
data = Reference(sheet, min_col=3, min_row=1, max_row=3)
```

3) Specify the label and the data range

```
chart.add_data(data, titles_from_data=True)
chart.set_categories(labels)
chart.title = "Height"
```

```
sheet.add_chart(chart, 'E1')
workbook.save('bmi_chart.xlsx')
```

4) Add the chart to the sheet, and save the file in another excel file.

# Create Excel Chart

```
import openpyxl
from openpyxl.chart import BarChart, Reference, Series
```

1) Import necessary functions

```
workbook = openpyxl.load_workbook("bmi.xlsx")
sheet=workbook["Sheet1"]
```

2) Load the data from excel file

```
chart = BarChart()
```

```
# first column is used as label, starting from row 2
labels = Reference(sheet, min_col=1, min_row=2, max_row=3)
```

3) Specify the label and the data range

```
# first row is used for header, that is why min_row is 1
data = Reference(sheet, min_col=3, min_row=1, max_row=3)
```

```
chart.add_data(data, titles_from_data=True)
chart.set_categories(labels)
chart.title = "Bar Chart"
chart.x_axis.title = "Name"
chart.y_axis.title = "Height"
chart.series[0].SeriesLabel = "height"
```

4) Specify values for title x-axis and y-axis for the chart

```
sheet.add_chart(chart, 'E1')
workbook.save('bmi_chart.xlsx')
```

5) Add the chart to the sheet, and save the file in another excel file.

# More Explanation on Chart Reference

- Write a script to list read an Excel file and output every even rows to a csv file.

```
data = Reference(sheet, min_col=3,  
min_row=1, max_row=3)
```

	A	B	C
1	name	weight	height
2	alan	65	1.75
3	peter	70	1.8

min\_col = 3 ← height

Min\_col = 2 ← weight

```
labels = Reference(sheet, min_col=1  
min_row=2, max_row=3)
```

Bar Chart

# Exercise

- **Write code to achieve the following:**
  1. Refer to the documentation at <https://openpyxl.readthedocs.io/en/stable/charts/pie.html#id1>
  2. Follow the instruction to create the following pie chart.

# Typical Workflow for Excel Automation

---

1

You are given some data in a spreadsheet

2

You want to do some or all of the following

- Analyze the data
- Manipulate the data
- Create visualization (Charts, Pivot Table etc)

3

Output the processed data in another spreadsheet

# Image Processing with Python

# Image Processing

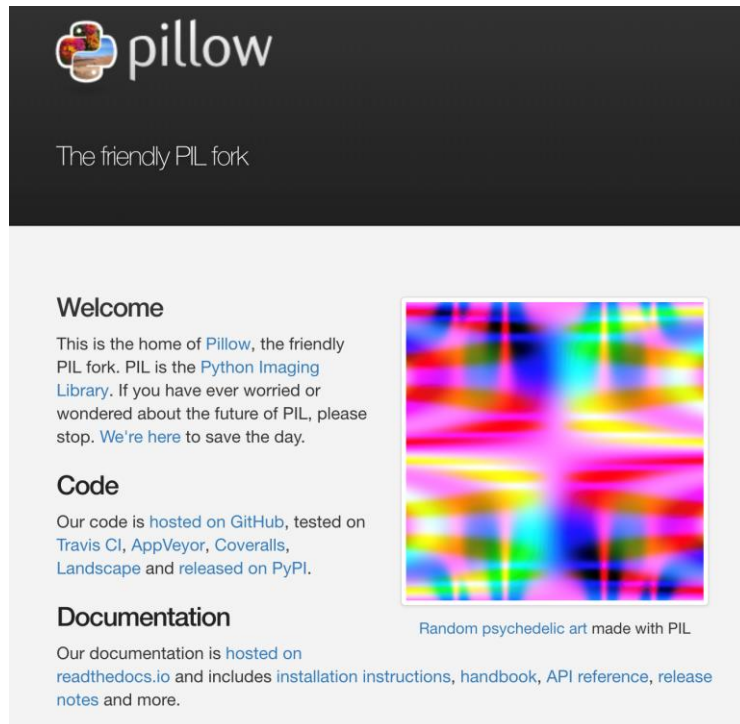

For the next section we are going to use the Python Image Library, or in short Pillow.

Install using the following command:

```
pip install pillow
```

The documentation is at:

<https://pillow.readthedocs.io/en/stable/handbook/overview.html>

The screenshot shows the Pillow website homepage. At the top, there's a dark header with the Pillow logo (a snake) and the text "pillow" and "The friendly PIL fork". Below this, the main content area has a light gray background. On the left, there's a "Welcome" section with text about Pillow being the friendly PIL fork. Next to it is a square image of random psychedelic art made with PIL. Below the welcome section are "Code" and "Documentation" sections, each with links to GitHub, Travis CI, AppVeyor, Coveralls, Landscape, and PyPI. The "Documentation" section also links to readthedocs.io.

**Welcome**

This is the home of [Pillow](#), the friendly PIL fork. PIL is the [Python Imaging Library](#). If you have ever worried or wondered about the future of PIL, please stop. [We're here](#) to save the day.

**Code**

Our code is hosted on [GitHub](#), tested on [Travis CI](#), [AppVeyor](#), [Coveralls](#), [Landscape](#) and released on [PyPI](#).

**Documentation**

Our documentation is hosted on [readthedocs.io](#) and includes [installation instructions](#), [handbook](#), [API reference](#), [release notes](#) and more.

Random psychedelic art made with PIL

# Image Processing

As a start we need to import it:  
`import Image`

We can open images with  
`im = Image.open(fullname)`

Then we can display the image using  
`im.show()`

Print some info about the image using  
`im.size` and `im.mode`

```
import os  
from PIL import Image
```

```
filename = "img/clungup.jpg"
```

```
im = Image.open(filename)
```

```
print ("%s - %s" % (im.size, im.mode))
```

```
# show the image  
im.show()
```

```
# close the file  
im.close()
```

Size: 800 x 600, Mode: RGB

# Image Processing

```
import os
from PIL import Image, ImageFilter

filename = "img/clungup.jpg"

im = Image.open(filename)

out = im.filter(ImageFilter.BLUR)

im.show()
out.show()
```

Pillow has many conversion and filters, to use filters we need to extend our import:

```
from PIL import Image,
ImageFilter
```

The way you can apply filters is :

```
out = im.filter(ImageFilter.BLUR)
```

Try other different filters!

# Image processing - filters

```
image = image.filter(ImageFilter.FIND_EDGES)
```

```
image = ImageOps.grayscale(image)
```

```
image = ImageOps.solarize(image)
```

```
image = image.filter(ImageFilter.CONTOUR)
```

\* Remember to include  
**ImageOps** in your import statement

# Image processing - filters

```
import os
from PIL import Image, ImageFilter, ImageOps

filename = "img/clungup.jpg"

im = Image.open(filename)

# Filter
#out = im.filter(ImageFilter.BLUR)
#out = im.filter(ImageFilter.FIND_EDGES)
#out = im.filter(ImageFilter.CONTOUR)

# ImageOps
out = ImageOps.grayscale(im)
#out = ImageOps.solarize(im)

im.show()
out.show()
```

\* Remember to include  
**ImageOps** in your import statement

# Image Processing - Rotating

Flipping the image horizontally or vertically

```
out = im.transpose(Image.FLIP_LEFT_RIGHT)
out = im.transpose(Image.FLIP_TOP_BOTTOM)
```

Flip images

Rotating the image

```
out = im.transpose(Image.ROTATE_90)
out = im.transpose(Image.ROTATE_180)
out = im.transpose(Image.ROTATE_270)
```

Rotate images

Contrast

First add ImageEnhance to our imports:

```
from PIL import Image, ImageFilter,
ImageEnhance
```

Then:

```
enh = ImageEnhance.Contrast(im)
out = enh.enhance(1.3)
```

make image brighter by  
changing the contrast

# Image Processing - Writing

---

```
import os
from PIL import Image, ImageFilter, ImageOps

filename = "clungup.jpg"

src_folder = "img/"
out_folder = "out/"

im = Image.open(src_folder + filename) # img/clungup.jpg
out = im.filter(ImageFilter.BLUR)

outFilename = out_folder + filename # out/clungup.jpg

out.save(outFilename)
```

You can see the image, but it's not being saved !

All you need to do to save the images in the "out" folder is:  
**out.save**(the name of the output file)

# Image processing – Converting

---

```
>>> fname1 = "holiday.gif"
>>> fname2 = fname1.split(".")[0] + ".jpg"
>>> print(fname2)
holiday.jpg
>>>
```

```
>>> fname1 = "holiday.gif"
>>> f, e = os.path.splitext(fname1)
>>> fname2 = f + ".jpg"
>>> print(fname2)
holiday.jpg
>>>
```

Maybe you want to keep all your photos in the same format.

We have some gif files and maybe you would have bmp or png images.

Pillow understands the output file, and will convert if the output file is different from the input.

fname1		fname2
holiday.gif	->	holiday.jpg

How can we convert the string holiday.gif to holiday.jpg ?

# Image processing – Converting

---

```
import os
from PIL import Image, ImageFilter, ImageOps

filename = "clungup.jpg"

src_folder = "img/"
out_folder = "out/"

im = Image.open(src_folder + filename) # img/clungup.jpg
out = im.filter(ImageFilter.BLUR)

# split the filename and the extension
f, e = os.path.splitext(filename)

# add the gif extension to the filename
fname2 = f + ".gif"

outFilename = out_folder + fname2 # out/clungup.gif

out.save(outFilename)
```

`os.path.splitext(file)` returns a list.  
We are only interested in `f` which is the first item in the list.

# Image processing – Watermark

Create the mark image →  
You can reduce the size to 100,100

```
mark = Image.open("img\\watermark.png")  
mark = mark.resize((100,100))
```

Create a new function called

```
def watermark(im, mark, position):  
    ....
```

It takes the original image, the watermark image and the desired position that we want the watermark to appear. The function will return the result.

We can use this function like:

```
watermark(im, mark, (0, 50)).show()
```

or

```
imOut = watermark(im, mark, (0,50))  
imOut.save(fileOut)
```

Maybe you want to leave a small footprint on your images, called watermark.

In this case we can use the \\img\\watermark.png and place it in each image on the bottom right.

Copyright  
@RP

# Image processing – Watermark

```
from PIL import Image
```

```
def watermark(im, mark, position):  
    layer = Image.new("RGBA", im.size, (0,0,0,0))  
    layer.paste(mark, position)  
    return Image.composite(layer, im, layer)
```

```
im = Image.open("img\\clungup.jpg")  
mark = Image.open("img\\watermark.png")  
mark = mark.resize((100,100))  
mark.putalpha(128)
```

```
out = watermark(im, mark, (0,0))  
out.show()
```

First we need to create a new layer with the size of the original image.

Then we paste the watermark image at the desired position and we return the composite.

Finally we merge the image and the layer together and return the result.

Then you can use it like this:

# Use Case I: Batch Resize

---

1. Find all the files in “img” folder with “.jpg” extension
1. Resize all the file to 60 x 90.
1. Save all the files to the resized folder

```
import os
from PIL import Image, ImageFilter, ImageOps

files = os.listdir('img')
size = 60, 90

for file in files:
    if file.lower().endswith(".jpg"):
        im = Image.open("img/" + file)
        im.thumbnail(size, Image.ANTIALIAS)
        im.save("resized/" + file, "JPEG")
```

# Use Case II: Batch Rename

---

1. Find all the files in “img” folder with “.jpg” extension
1. Copy all the files to the renamed folder
1. Rename all the files with the “s-” prefix.

```
import os
import shutil

files = os.listdir('img')

for file in files:
    if file.lower().endswith(".jpg"):
        shutil.copyfile("img/" + file, "renamed/s-" + file[:-4] + ".jpg")
```

# Web Automation with Python

# Connecting to the Web

- requests – download files and web pages from the Web

pip install requests

```
1 import requests
2
3 url = "https://api.data.gov.sg/v1/environment/2-hour-weather-forecast"

# Email Automation with Python

# Send Email

- SMTP (Simple Mail Transfer Protocol) is used for sending and delivering from a client to a server via port 25, 465 or 587: it's the **outgoing server**.
- IMAP and POP are two methods to access email. IMAP is the recommended method when you need to check your emails from several different devices, such as a phone, laptop, and tablet.

<https://www.mailgun.com/blog/which-smtp-port-understanding-ports-25-465-587/>

<https://serversmtp.com/what-is-smtp-server/>

# Send Email

- **Note:** The SMTP servers used when you send your emails- Hotmail, Gmail , Yahoo Mail – are **shared among users**
- Common providers establish some **strict limits** on the number of emails you can send (e.g. Yahoo's restriction is 100 emails per hour).
- If you plan to send a bulk email or set up an email campaign you should opt for a professional outgoing email server like turboSMTP,
- which guarantees a controlled IP and ensure that all your messages reach their destination.

# Send Email using Gmail

---

Incoming Mail (IMAP) Server	imap.gmail.com Requires SSL: Yes Port: 993
Outgoing Mail (SMTP) Server	smtp.gmail.com Requires SSL: Yes Requires TLS: Yes (if available) Requires Authentication: Yes Port for SSL: 465 Port for TLS/STARTTLS: 587
Full Name or Display Name	Your name
Account Name, User name, or Email address	Your full email address
Password	Your Gmail password

Note: If you are using your office network, most port numbers, including 587, may be blocked.

# Send Email using Gmail

---

- Import smtplib module
- Specify Gmail email & password, receiver's email address, email title & content
- Connect to SMTP server using Port 587
- Call starttls() to enable encryption for your connection
- Login using email and password
- Call sendmail()
- Call quit() to disconnect from the SMTP server

```
import smtplib
```

```
sender_email_address = "your_email_address@gmail.com"  
sender_email_password = "xxxxxxxxxxxxxxxx"  
receiver_email_address = "another_email_address@gmail.com"  
email_title_content = "Subject: Sending Email Using Python\nThis is a test email."
```

```
email_title_content = "Subject: Sending Email Using Python\nThis is a test email."
```

➤ The start of the email body must begin with "Subject: " for the subject line. The "\n" newline character separates the subject line from the main body content.

```
print("Trying to connect to Gmail SMTP server")  
smtpObj = smtplib.SMTP("smtp.gmail.com", 587)  
smtpObj.starttls()
```

```
print("Connected. Logging in...")  
smtpObj.login(sender_email_address, sender_email_password)
```

```
smtpObj.sendmail(sender_email_address, receiver_email_address, email_title_content)  
print("Email sent successfully...")
```

```
smtpObj.quit()
```

# Send Email using Gmail

# Send Email using Gmail

## Steps To Create Google App Password

Step 1: Login to Gmail. Go to Account ☐ Signing in to Google

Step 2: Make sure that 2-Step Verification is on

Step 3: Create an App password

← App passwords

App passwords let you sign in to your Google Account from apps on devices that don't support 2-Step Verification. You'll only need to enter it once so you don't need to remember it. [Learn more](#)

You don't have any app passwords.

Select the app and device you want to generate the app password for.

Mail ▼ Windows Computer ▼

**GENERATE**

### Generated app password

Add your Google account

Enter the information below to connect to your Google account.

Email address  
securesally@gmail.com

Password  
\*\*\*\*\*

☐ Include your Google contacts and calendars

Your app password for Windows Computer

16-digit app password

### How to use it

1. Open the "Mail" app.
2. Open the "Settings" menu.
3. Select "Accounts" and then select your Google Account.
4. Replace your password with the 16-character password shown above.

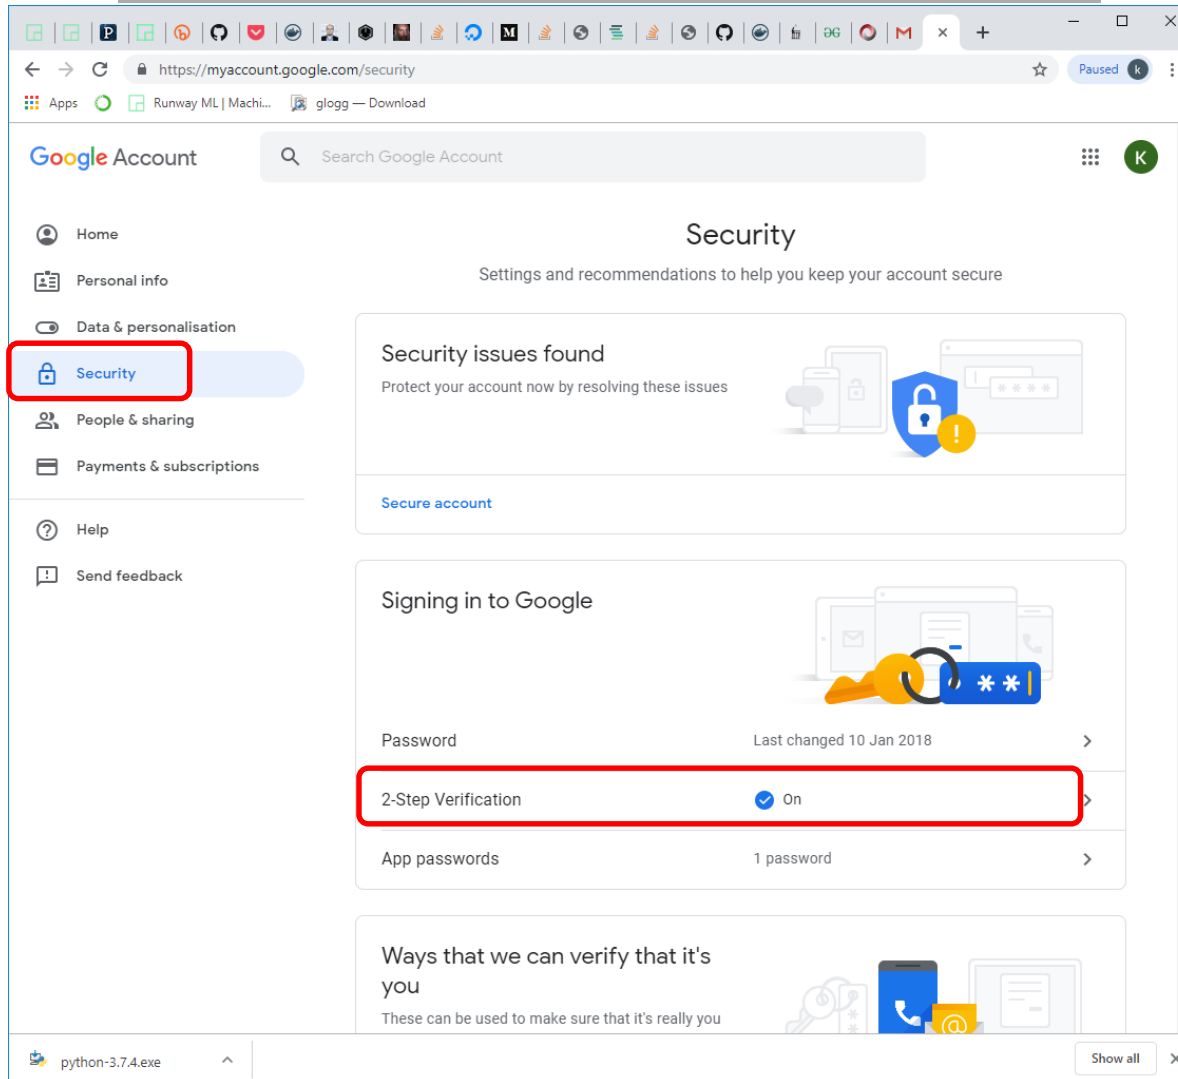

Just like your normal password, this app password grants complete access to your Google Account. You won't need to remember it, so don't write it down or share it with anyone.

[Learn more](#)

DONE

# Send Email using Gmail

The screenshot shows the Google Account Security page in a web browser. The browser's address bar displays the URL `https://myaccount.google.com/security`. The page features a left-hand navigation menu with the following items: Home, Personal info, Data & personalisation, **Security** (highlighted with a red rectangle), People & sharing, Payments & subscriptions, Help, and Send feedback. The main content area is titled "Security" and includes the subtitle "Settings and recommendations to help you keep your account secure". It contains three primary sections: "Security issues found" with a "Secure account" link; "Signing in to Google" which lists "Password" (last changed 10 Jan 2018), "2-Step Verification" (set to "On" and highlighted with a red rectangle), and "App passwords" (1 password); and "Ways that we can verify that it's you". The bottom of the browser window shows a taskbar with a "python-3.7.4.exe" window and a "Show all" button.

# Send Email using Gmail

---

- Replace your actual password with the App password

```
import smtplib

sender_email_address = "your_email_address@gmail.com"
sender_email_password = "xxxxxxxxxxxxxxxxxx"
receiver_email_address = "another_email_address@gmail.com"
email_title_content = "Subject: Sending Email Using Python\nThis is a test email."
```

- Run your email program

```
C:\Users\denise_quek\AppData\Local\Programs\Python\Python37\python.exe D:/CET_Python/Denise/TestEmail.py
Trying to connect to Gmail SMTP server
Connected. Logging in...
Email sent successfully...

Process finished with exit code 0
```

# Use Case: Send emails to students

- Send email to students who were absent

	A	B	C
1	Student	Email	Status
2	Alicia	code.musically@gmail.com	Present
3	Bryan	code.musically@gmail.com	Present
4	Carol	code.musically@gmail.com	Absent
5	David	code.musically@gmail.com	Absent
6	Evelyn	code.musically@gmail.com	Present
7			

Sheet1

```
1  #!/ python3
2
3  import openpyxl, smtplib
4

## FPDF for Python

*PyFPDF* is a library for PDF document generation under Python, ported from PHP (see [FPDF](#): "Free"-PDF, a well-known PDFlib-extension replacement with many examples, scripts and derivatives).

Latest Released Version: 1.7 (August 15th, 2012) - Current Development Version: 1.7.1

### Main features

- Easy to use (and easy to extend)
- Many simple examples and scripts available in many languages
- No external dependencies or extensions (optionally PIL for GIF support)
- No installation, no compilation or other libraries (DLLs) required
- Small and compact code, useful for testing new features and teaching

This repository is a fork of the library's [original port by Max Pat](#), with the following enhancements:

- Python 2.5 to 3.4+ support (see [Python3 support](#))
- [Unicode](#) (UTF-8) TrueType font subset embedding (Central European, Cyrillic, Greek, Baltic, Thai, Chinese, Japanese, Korean, Hindi and almost any other language in the world) **New!** based on [sFPDF](#) LGPL3 PHP version from [Ian Back](#)
- Improved installers ([setup.py](#), [py2exe](#), [PyPI](#)) support
- Barcode 12of5 and code39, QR code coming soon ...
- PNG, GIF and JPG support (including transparency and alpha channel) **New!**
- Exceptions support, other minor fixes, improvements and PEP8 code cleanups
- Port of the [Tutorial](#) and [ReferenceManual](#) (Spanish translation available)

FPDF original features:

- Install fpdf
  - `pip install fpdf`

<https://pyfpdf.readthedocs.io/en/latest/Tutorial/index.html>

# PDF – Basic document

```
import fpdf

#create a new pdf
document = fpdf.FPDF()

#define font and color for title and add the first page
document.set_font("Times", "B", 14)
document.set_text_color(19, 83, 173)
document.add_page()

#write the title of the document
document.cell(0, 5, "PDF Test Document")
document.ln()

#write a long paragraph
document.set_font("Times", "", 11)
document.set_text_color(0)
document.multi_cell(0, 10, "This is an example of a long paragraph. \n" * 10)
document.ln()

#save the document
document.output("pdf_report.pdf")
```

- Import fpdf
- Create a new pdf document
- Add page
- Add text
- Save file

## PDF Test Document

This is an example of a long paragraph.

# PDF – adding images

```
import fpdf

#create a new pdf
document = fpdf.FPDF()

#define font and color for title and add the first page
document.set_font("Times", "B", 14)
document.set_text_color(19, 83, 173)
document.add_page()

#add a image
document.image("rp_logo.png", x=10, y=5, w=23)

document.set_y(40);

#write the title of the document
document.cell(0, 5, "PDF Test Document")
document.ln()

#write a long paragraph
document.set_font("Times", "", 11)
document.set_text_color(0)
document.multi_cell(0, 5, "This is an example of a long paragraph. " * 10)
document.ln()

#save the document
document.output("pdf_report.pdf")
```

- Import fpdf
- Create a new pdf document
- Add page
- Add text, logo
- Save file

pip install matplotlib

Full documentation:  
<https://matplotlib.org/>

# Charting

```
1 import matplotlib.pyplot as plt
2
3 #set up values
4 VALUES = [100,150,125,170]
5 POS = [0,1,2,3]
6 LABELS = ['Q1 2018', 'Q2 2018', 'Q3 2018', 'Q4 2018']
7
8 #set up the chart
9 plt.bar(POS,VALUES)
10 plt.xticks(POS, LABELS)
11 plt.ylabel('Sales')
12
13 #to display the chart
14 plt.show()
```

- Install matplotlib
- Prepare data
- Create bar graph
- Display the chart

[https://matplotlib.org/api/\\_as\\_gen/matplotlib.pyplot.bar.html](https://matplotlib.org/api/_as_gen/matplotlib.pyplot.bar.html)

# Charting - Formatting

```

1 import matplotlib.pyplot as plt
2 from matplotlib.ticker import FuncFormatter
3
4 def value_format(value, position):
5     return '$ {}'.format(int(value))
6
7 # set up values
8 VALUES = [100,150,125,170]
9 POS = [0,1,2,3]
10 LABELS = ['Q1 2018', 'Q2 2018', 'Q3 2018', 'Q4 2018']
11
12 # set up the chart
13 # Colors can be specified in multiple formats, as
14 # described in https://matplotlib.org/api/colors_api.html
15 # https://xkcd.com/color/rgb/
16 plt.bar(POS, VALUES, color='xkcd:moss green')
17 plt.xticks(POS, LABELS)
18 plt.ylabel('Sales')
19
20 # retrieve the current axes and apply formatter |
21 axes = plt.gca()
22 axes.yaxis.set_major_formatter(FuncFormatter(value_format))
23
24 # to display the chart
25 plt.show()

```

- Install matplotlib
- Prepare data
- Customise graph options
- Create bar graph
- Display the chart

# Charting - Subplots

- Multiple charts

2 rows, 1 column, index starting from 1)

```

1  import matplotlib.pyplot as plt
2
3  #set up values

19     data_x.append(float(x))
20     data_y.append(float(y))
21
22 plt.scatter(data_x, data_y)
23
24 plt.gca().xaxis.set_major_formatter(FuncFormatter(format_minutes))
25 plt.xlabel('Time in website')
26 plt.gca().yaxis.set_major_formatter(FuncFormatter(format_dollars))
27 plt.ylabel('Spending')
28
29 plt.show()
```

- To save a plot:  
`plt.savefig(filename)`
- Save the plot before you display

# End of Day 2

---

This concludes the Introduction to Python,  
I hope you enjoyed it.

Thank you !

QUESTIONS ?

# TRAQOM survey

---

- **Link sent by SSG via Email or SMS**
- **Message looks like:**  
*“You’ve completed a course supported by SSG. Pls complete the TRAQOM survey at this link:

- **Do let us know if you have not received**
- **Please complete the survey found in the link**

# Where to go from here ?

---

Getting started step by step

<http://www.python.org/about/gettingstarted/>

Run through the python tutorials:

<http://docs.python.org/tutorial/index.html>

Keep the API doc under your pillow:

<http://docs.python.org/library/index.html>

Advanced examples:

<https://diveintopython3.problemsolving.io/>

# Where to go from here ?

MOOC:  
DataCamp

<https://www.datacamp.com/>

Edx

<https://www.edx.org/learn/python>

Udemy

<https://www.udemy.com/topic/python/>

The screenshot displays the DataCamp website interface. At the top, a purple banner promotes a 50% discount on subscriptions. Below this, a search bar shows 'python' with 57 results. Three course cards are visible: 'Intro to Python for Data Science' by Filip Schouwenars (4 hours), 'Intermediate Python for Data Science' by Filip Schouwenars (4 hours), and 'Python Data Science Toolbox (Part 1)' by Hugo Bowne-Anderson (3 hours). Below these, more courses like 'Deep Learning in Python' and 'Supervised Learning with scikit-learn' are partially visible. On the right, a section titled 'Accelerate your future. Learn anytime, anywhere.' features a 'Find courses' button and a search bar. At the bottom, a dark blue banner for 'CYBER MONDAY' offers a 15% discount on purchases, with a 'Start Exploring' button. Logos of partner institutions like MIT, Harvard, and Berkeley are also present.

# Where to go from here ?

---

*How to think like a computer scientist* is an introduction to Python programming for beginners. It starts with basic concepts of programming, and is carefully designed to define all terms when they are first used and to develop each new concept in a logical progression. Larger pieces, like recursion and object-oriented programming are divided into a sequence of smaller steps and introduced over the course of several chapters.

*How to think like a computer scientist* is a Free Book. It is available under the [GNU Free Documentation License](https://www.gnu.org/licenses/old/licenses.html), which means that you are free to copy, distribute, and modify it, as long as derivative works of the document must themselves be free in the same sense.

## Short Courses

SOI offers an extensive variety of short, industry-relevant courses for ICT skills upgrading and skills acquisition. Our courses are categorized under different areas, ranging from Artificial Intelligence (AI), Business Intelligence/ Business Analytics (BI/BA), Business Processes (BP), Unmanned Aerial Vehicle (UAV), IT Security, New/ Digital Media, Software Development to the Internet of Things (IoT). To view our short course offerings, click on the relevant tab below.

AI	Data Analytics	IT Security	DevOps	Software Development	New/ Digital Media	UAV	RPA
----	----------------	-------------	--------	----------------------	--------------------	-----	-----

- + Artificial Intelligence for Everyone - A Practical Experience (1 day Beginner)
- + Artificial Intelligence for Techies - A Hands-On Approach (1 day Beginner)
- + An Introduction to Code-Free Machine Learning (1 day Beginner)
